Description	Authority / Laboratory	No. / date of issue
European technical approval <sup>a)</sup>	DIBt, Berlin	ETA-04/0084 / 2009-12-09

a) All data given in this section according ETA-04/0084, issue 2009-12-09.

## Basic loading data (for a single anchor)

### All data in this section applies to

- Correct setting (See setting instruction)
- No edge distance and spacing influence
- Steel failure
- Base material thickness, as specified in the table
- Embedment depth, as specified in the table
- One anchor material, as specified in the tables
- Concrete C 20/25,  $f_{ck,cube} = 25 \text{ N/mm}^2$
- Temperate range I  
(min. base material temperature -40°C, max. long term/short term base material temperature: +50°C/80°C)
- Installation temperature range +5°C to +40°C

## Service temperature range

Hilti HIT-HY 150 MAX injection mortar with anchor rod HIT-TZ may be applied in the temperature ranges given below. An elevated base material temperature may lead to a reduction of the design bond resistance.

Temperature range	Base material temperature	Maximum long term base material temperature	Maximum short term base material temperature
Temperature range I	-40 °C to +80 °C	+50 °C	+80 °C

### Max short term base material temperature

Short-term elevated base material temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling.

### Max long term base material temperature

Long-term elevated base material temperatures are roughly constant over significant periods of time.

## Setting

### Installation equipment

Anchor size	M8	M10	M12	M16	M20
Rotary hammer		TE 2 – TE 16		TE 40 - TE 70	

## Setting instruction

Dry, water-saturated concrete, under water, hammer drilling and diamond coring

1. Diamond coring is permissible only when the Hilti DD EC-1 diamond core drilling machine and the corresponding DD-C core bit are used.
2. Check the setting depth and compress the drilling dust. It is not necessary to clean the hole.
3. For use with Hilti HIT-HY 150 / Hilti HIT-HY 150 MAX. Read the instructions before use.

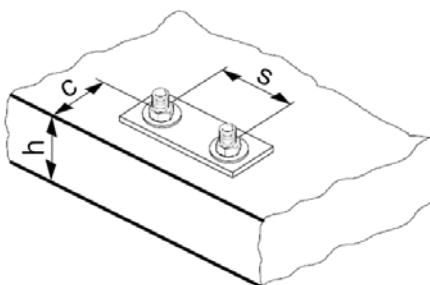

For detailed information on installation see instruction for use given with the package of the product.

### Curing time for general conditions

Temperature of the base material	Curing time before anchor can be fully loaded $t_{cure}$
30 °C to 40 °C	30 min
20 °C to <30 °C	30 min
5 °C to <20 °C	60 min

For spacing (edge distance) smaller than critical spacing (critical edge distance) the design loads have to be reduced.

- a)  $h$ : base material thickness ( $h \geq h_{min}$ )

## Simplified design method

Simplified version of the design method according ETAG 001, Annex C. Design resistance according data given in ETA-04/0084, issue 2009-12-09.

- Influence of concrete strength
- Influence of edge distance
- Influence of spacing
- Valid for a group of two anchors. (The method may also be applied for anchor groups with more than two anchors or more than one edge distance. The influencing factors must then be considered for each edge distance and spacing. The calculated design loads are then on the same side: They will be lower than the exact values according ETAG 001, Annex C. To avoid this, it is recommended to use the anchor design software PROFIS anchor)

The design method is based on the following simplification:

- No different loads are acting on individual anchors (no eccentricity)

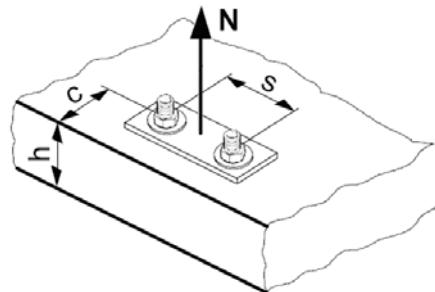

The values are valid for one anchor.

For more complex fastening applications please use the anchor design software PROFIS Anchor.

## Tension loading

**The design tensile resistance is the lower value of**

- Steel resistance:  $N_{Rd,s}$
- Combined pull-out and concrete cone resistance:  $N_{Rd,p} = N^0_{Rd,p} \cdot f_{B,p} \cdot f_{h,p}$
- Concrete cone resistance:  $N_{Rd,c} = N^0_{Rd,c} \cdot f_B \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{h,N} \cdot f_{re,N}$
- Concrete splitting resistance (only non-cracked concrete):  $N_{Rd,sp} = N^0_{Rd,sp} \cdot f_B \cdot f_{1,sp} \cdot f_{2,sp} \cdot f_{3,sp} \cdot f_{h,sp} \cdot f_{re,N}$

$f_{3,sp} = 0,5 \cdot (1 + s/s_{cr,sp})$										

a) The anchor spacing shall not be smaller than the minimum anchor spacing  $s_{min}$  given in the table with the setting details. This influencing factor must be considered for every anchor spacing.

### Influence of embedment depth on concrete cone resistance

$$f_{h,N} = (h_{ef}/h_{ef,typ})^{1,5}$$

### Influence of reinforcement

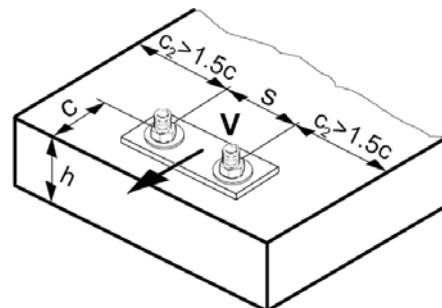

$h_{ef}$ [mm]	80	90	$\geq 100$
$f_{re,N} = 0,5 + h_{ef}/200mm \leq 1$	0,9 <sup>a)</sup>	0,95 <sup>a)</sup>	1

a) This factor applies only for dense reinforcement. If in the area of anchorage there is reinforcement with a spacing  $\geq 150$  mm (any diameter) or with a diameter  $\leq 10$  mm and a spacing  $\geq 100$  mm, then a factor  $f_{re} = 1$  may be applied.

## Shear loading

The design shear resistance is the lower value of

- Steel resistance:  $V_{Rd,s}$
- Concrete prout resistance:  $V_{Rd,cp} = k \cdot \text{lower value of } N_{Rd,p} \text{ and } N_{Rd,c}$
- Concrete edge resistance:  $V_{Rd,c} = V_{Rd,c}^0 \cdot f_B \cdot f_\beta \cdot f_h \cdot f_4$

## Precalculated values

Recommended loads can be calculated by dividing the design resistance by an overall partial safety factor for action  $\gamma = 1,4$ . The partial safety factors for action depend on the type of loading and shall be taken from national regulations.

a) All data given in this section according ETA-08/0352 issue 2010-04-01.

## Basic loading data (for a single anchor)

All data in this section applies to

- Correct setting (See setting instruction)
- No edge distance and spacing influence
- Steel failure
- Base material thickness, as specified in the table
- One typical embedment depth, as specified in the table
- One anchor material, as specified in the tables
- Concrete C 20/25,  $f_{ck,cube} = 25 \text{ N/mm}^2$
- Temperate range I  
(min. base material temperature -40°C, max. long term/short term base material temperature: +24°C/40°C)
- Installation temperature range -10°C to +40°C

For details see Simplified design method

## Service temperature range

Hilti HIT-HY 150 MAX injection mortar may be applied in the temperature ranges given below. An elevated base material temperature may lead to a reduction of the design bond resistance.

Temperature range	Base material temperature	Maximum long term base material temperature	Maximum short term base material temperature
Temperature range I	-40 °C to +40 °C	+24 °C	+40 °C
Temperature range II	-40 °C to +80 °C	+50 °C	+80 °C
Temperature range III	-40 °C to +120 °C	+72 °C	+120 °C

### Max short term base material temperature

Short-term elevated base material temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling.

### Max long term base material temperature

Long-term elevated base material temperatures are roughly constant over significant periods of time.

For spacing (or edge distance) smaller than critical spacing (or critical edge distance) the design loads have to be reduced.

- a) Embedment depth range:  $h_{\text{ef,min}} \leq h_{\text{ef}} \leq h_{\text{ef,max}}$
- b) Maximum recommended torque moment to avoid splitting failure during installation with minimum spacing and/or edge distance.
- c)  $h$ : base material thickness ( $h \geq h_{\text{min}}$ ),  $h_{\text{ef}}$ : embedment depth
- d) The critical edge distance for concrete cone failure depends on the embedment depth  $h_{\text{ef}}$  and the design bond resistance. The simplified formula given in this table is on the save side.

## Simplified design method

Simplified version of the design method according ETAG 001, TR 029. Design resistance according data given in ETA-08/0352, issue 2010-04-01.

- Influence of concrete strength
- Influence of edge distance
- Influence of spacing
- Valid for a group of two anchors. (The method may also be applied for anchor groups with more than two anchors or more than one edge distance. The influencing factors must then be considered for each edge distance and spacing. The calculated design loads are then on the same side: They will be lower than the exact values according ETAG 001, TR 029. To avoid this, it is recommended to use the anchor design software PROFIS anchor)

The design method is based on the following simplification:

- No different loads are acting on individual anchors (no eccentricity)

The values are valid for one anchor.

For more complex fastening applications please use the anchor design software PROFIS Anchor.

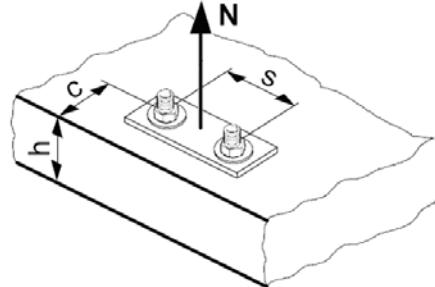

## TENSION loading

**The design tensile resistance is the lower value of**

- Steel resistance:  $N_{Rd,s}$
- Combined pull-out and concrete cone resistance:  

$$N_{Rd,p} = N_{Rd,c}^0 \cdot f_{B,p} \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{h,p} \cdot f_{re,N}$$
- Concrete cone resistance:  $N_{Rd,c} = N_{Rd,c}^0 \cdot f_B \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{h,N} \cdot f_{re,N}$
- Concrete splitting resistance (only non-cracked concrete):  

$$N_{Rd,sp} = N_{Rd,c}^0 \cdot f_B \cdot f_{1,sp} \cdot f_{2,sp} \cdot f_{3,sp} \cdot f_{h,N} \cdot f_{re,N}$$

$f_{3,sp} = 0,5 \cdot (1 + s/s_{cr,sp}) \leq 1$										

- a) The anchor spacing shall not be smaller than the minimum anchor spacing  $s_{min}$ . This influencing factor must be considered for every anchor spacing.

### Influence of embedment depth on concrete cone resistance

$$f_{h,N} = (h_{ef}/h_{ef,typ})^{1,5}$$

### Influence of reinforcement

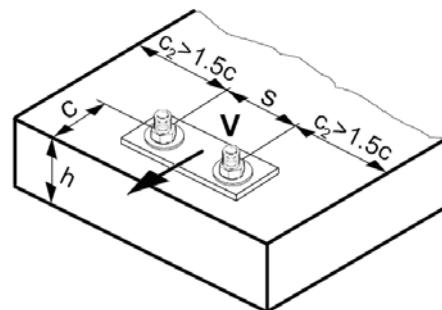

$h_{ef}$ [mm]	40	50	60	70	80	90	$\geq 100$
$f_{re,N} = 0,5 + h_{ef}/200\text{mm} \leq 1$	0,7 <sup>a)</sup>	0,75 <sup>a)</sup>	0,8 <sup>a)</sup>	0,85 <sup>a)</sup>	0,9 <sup>a)</sup>	0,95 <sup>a)</sup>	1

- a) This factor applies only for dense reinforcement. If in the area of anchorage there is reinforcement with a spacing  $\geq 150$  mm (any diameter) or with a diameter  $\leq 10$  mm and a spacing  $\geq 100$  mm, then a factor  $f_{re,N} = 1$  may be applied.

## SHEAR loading

The design shear resistance is the lower value of

- Steel resistance:  $V_{Rd,s}$
- Concrete prout resistance:  $V_{Rd,cp} = k \cdot \text{lower value of } N_{Rd,p} \text{ and } N_{Rd,c}$
- Concrete edge resistance:  $V_{Rd,c} = V_{Rd,c}^0 \cdot f_B \cdot f_B \cdot f_h \cdot f_4 \cdot f_{hef} \cdot f_c$

## Combined TENSION and SHEAR loading

For combined tension and shear loading see section "Anchor Design".

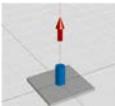

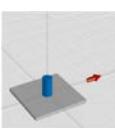

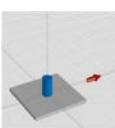

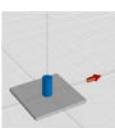

## Precalculated values – design resistance values

All data applies to:

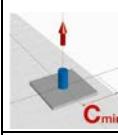

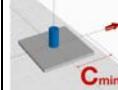

- non-cracked concrete C 20/25 –  $f_{ck,cube} = 25 \text{ N/mm}^2$
- temperature range I (see service temperature range)
- minimum thickness of base material
- no effects of dense reinforcement

Recommended loads can be calculated by dividing the design resistance by an overall partial safety factor for action  $\gamma = 1,4$ . The partial safety factors for action depend on the type of loading and shall be taken from national regulations.

**Service temperature range**

Hilti HIT-HY 150 MAX injection mortar may be applied in the temperature ranges given below. An elevated base material temperature may lead to a reduction of the design bond resistance.

Temperature range	Base material temperature	Maximum long term base material temperature	Maximum short term base material temperature
Temperature range I	-40 °C to +40 °C	+24 °C	+40 °C
Temperature range II	-40 °C to +80 °C	+50 °C	+80 °C
Temperature range III	-40 °C to +120 °C	+72 °C	+120 °C

**Max short term base material temperature**

Short-term elevated base material temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling.

**Max long term base material temperature**

Long-term elevated base material temperatures are roughly constant over significant periods of time.

Thread engagement length; min - max $h_s$ [mm]	8-20	10-25	12-30	16-40	20-50
Torque moment <sup>a)</sup> $T_{\max}$ [Nm]	10	20	40	80	150
Minimum spacing $s_{\min}$ [mm]	40	45	55	65	90
Minimum edge distance $c_{\min}$ [mm]	40	45	55	65	90
Critical spacing for splitting failure $s_{\text{cr,sp}}$ [mm]	2 $c_{\text{cr,sp}}$				
Critical edge distance for splitting failure <sup>c)</sup> $c_{\text{cr,sp}}$ [mm]	$1,0 \cdot h_{\text{ef}}$ for $h / h_{\text{ef}} \geq 2,0$				
	$4,6 h_{\text{ef}} - 1,8 h$ for $2,0 > h / h_{\text{ef}} > 1,3$				
	$2,26 h_{\text{ef}}$ for $h / h_{\text{ef}} \leq 1,3$				
Critical spacing for concrete cone failure $s_{\text{cr,N}}$ [mm]	2 $c_{\text{cr,N}}$				
Critical edge distance for concrete cone failure <sup>c)</sup> $c_{\text{cr,N}}$ [mm]	1,5 $h_{\text{ef}}$				

For spacing (or edge distance) smaller than critical spacing (or critical edge distance) the design loads have to be reduced.

- a) Maximum recommended torque moment to avoid splitting failure during installation with minimum spacing and/or edge distance.
- b)  $h$ : base material thickness ( $h \geq h_{\min}$ ),  $h_{\text{ef}}$ : embedment depth
- c) The critical edge distance for concrete cone failure depends on the embedment depth  $h_{\text{ef}}$  and the design bond resistance. The simplified formula given in this table is on the save side.

## Simplified design method

Simplified version of the design method according ETAG 001, TR 029. Design resistance according data given in ETA-08/0352, issue 2010-04-01.

- Influence of concrete strength
- Influence of edge distance
- Influence of spacing
- Valid for a group of two anchors. (The method may also be applied for anchor groups with more than two anchors or more than one edge distance. The influencing factors must then be considered for each edge distance and spacing. The calculated design loads are then on the same side: They will be lower than the exact values according ETAG 001, TR 029. To avoid this, it is recommended to use the anchor design software PROFIS anchor)

The design method is based on the following simplification:

- No different loads are acting on individual anchors (no eccentricity)

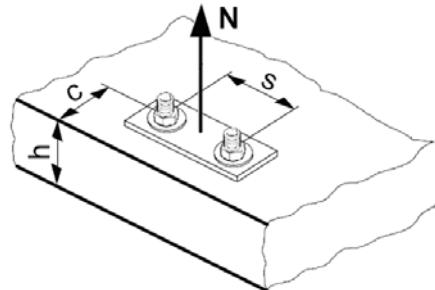

The values are valid for one anchor.

For more complex fastening applications please use the anchor design software PROFIS Anchor.

## TENSION loading

**The design tensile resistance is the lower value of**

- Steel resistance:  $N_{Rd,s}$
- Combined pull-out and concrete cone resistance:  $N_{Rd,p} = N^0_{Rd,p} \cdot f_{B,p} \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{h,p} \cdot f_{re,N}$

## Combined TENSION and SHEAR loading

For combined tension and shear loading see section "Anchor Design".

## Precalculated values – design resistance values

All data applies to:

- non-cracked concrete C 20/25 –  $f_{ck,cube} = 25 \text{ N/mm}^2$
- temperature range I (see service temperature range)
- minimum thickness of base material
- no effects of dense reinforcement

Recommended loads can be calculated by dividing the design resistance by an overall partial safety factor for action  $\gamma = 1,4$ . The partial safety factors for action depend on the type of loading and shall be taken from national regulations.

## Basic loading data (for a single anchor)

### All data in this section applies to

- Correct setting (See setting instruction)
- No edge distance and spacing influence
- **Steel failure**
- Base material thickness, as specified in the table
- One typical embedment depth, as specified in the table
- Anchor material: rebar BSt 500 S
- Concrete C 20/25,  $f_{ck,cube} = 25 \text{ N/mm}^2$
- Temperate range I  
(min. base material temperature -40°C, max. long term/short term base material temperature: +24°C/40°C)
- Installation temperature range -10°C to +40°C

## Service temperature range

Hilti HIT-HY 150 MAX injection mortar may be applied in the temperature ranges given below. An elevated base material temperature may lead to a reduction of the design bond resistance.

Temperature range	Base material temperature	Maximum long term base material temperature	Maximum short term base material temperature
Temperature range I	-40 °C to +40 °C	+24 °C	+40 °C
Temperature range II	-40 °C to +80 °C	+50 °C	+80 °C
Temperature range III	-40 °C to +120 °C	+72 °C	+120 °C

### Max short term base material temperature

Short-term elevated base material temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling.

### Max long term base material temperature

Long-term elevated base material temperatures are roughly constant over significant periods of time.

For spacing (or edge distance) smaller than critical spacing (or critical edge distance) the design loads have to be reduced.

- a) Embedment depth range:  $h_{ef,min} \leq h_{ef} \leq h_{ef,max}$
- b)  $h$ : base material thickness ( $h \geq h_{min}$ ),  $h_{ef}$ : embedment depth
- c) The critical edge distance for concrete cone failure depends on the embedment depth  $h_{ef}$  and the design bond resistance. The simplified formula given in this table is on the save side.
- d) both given values for drill bit diameter can be used

## Simplified design method

Simplified version of the design method according ETAG 001, TR 029. Design resistance according data given in ETA-08/0352, issue 2010-04-01.

- Influence of concrete strength
- Influence of edge distance
- Influence of spacing
- Valid for a group of two anchors. (The method may also be applied for anchor groups with more than two anchors or more than one edge distance. The influencing factors must then be considered for each edge distance and spacing. The calculated design loads are then on the same side: They will be lower than the exact values according ETAG 001, TR 029. To avoid this, it is recommended to use the anchor design software PROFIS anchor)

The design method is based on the following simplification:

- No different loads are acting on individual anchors (no eccentricity)

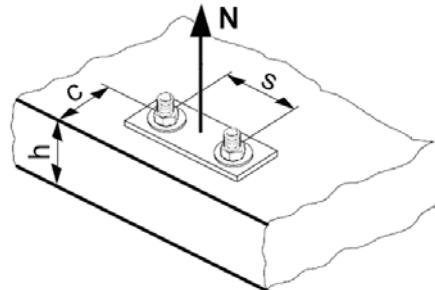

The values are valid for one anchor.

For more complex fastening applications please use the anchor design software PROFIS Anchor.

## TENSION loading

**The design tensile resistance is the lower value of**

- Steel resistance:  $N_{Rd,s}$
- Combined pull-out and concrete cone resistance:  $N_{Rd,p} = N^0_{Rd,p} \cdot f_{B,p} \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{h,p} \cdot f_{re,N}$
- Concrete cone resistance:  $N_{Rd,c} = N^0_{Rd,c} \cdot f_B \cdot f_{1,N} \cdot f_{2,N} \cdot f_{3,N} \cdot f_{h,N} \cdot f_{re,N}$
- Concrete splitting resistance (only non-cracked concrete):  $N_{Rd,sp} = N^0_{Rd,sp} \cdot f_B \cdot f_{1,sp} \cdot f_{2,sp} \cdot f_{3,sp} \cdot f_{h,N} \cdot f_{re,N}$

## Combined TENSION and SHEAR loading

For combined tension and shear loading see section “Anchor Design”.

### Precalculated values – design resistance values

All data applies to:

- non-cracked concrete C 20/25 –  $f_{ck,cube} = 25 \text{ N/mm}^2$
- temperature range I (see service temperature range)
- minimum thickness of base material
- no effects of dense reinforcement

Recommended loads can be calculated by dividing the design resistance by an overall partial safety factor for action  $\gamma = 1,4$ . The partial safety factors for action depend on the type of loading and shall be taken from national regulations.
